

TRY A PHONE AGENT CAREFULLY

Start with a reversible task and check what the agent actually did.

nanoMuse is an open-source personal agent project with phone, desktop and browser components. Use the current README and releases for device requirements; model and relay choices affect where your data goes.

Run your first controlled task

1. Begin with the project's demo or a spare device. Read permissions and install instructions before connecting personal accounts.
2. Choose a harmless task, such as finding information in a test app. State the finish condition and ask it to stop before sending, purchasing or deleting.
3. Observe each action. Check that the app, account, text and final state match what you requested.
4. Review the chosen model provider and relay. Keep credentials and verification codes for yourself to enter.

Copy this task brief

In [test app], do [reversible task]. Finish when [visible condition]. Use only [allowed apps]. Stop before sending a message, making a purchase, deleting anything or granting new permissions. If a login or unexpected screen appears, pause and ask me.

Your acceptance check

1. Correct app/account: _____ Requested result visible: _____
2. Unexpected actions: _____ Permissions and data path reviewed: _____
